

TUNGSTUDS: THE PERFECT CHOICE

SIP&T is a leading company in the engineering industry based in Italy since 1996. We are highly specialized in the construction of Kelly bars and foundation drilling tools to be used for civil engineering works.

Owing to our wide product range and our ever-growing knowledge, we are considered one of the most qualified companies in the ground engineering field.

Thanks to our network, all goods are worldwide distributed to fulfil the requirements of the most challenging job sites in the world.

Our company mission is to supply customers with innovative and reliable solutions and for this reason during Geofluid Expo 2012 we decided to introduce TungStuds concept as an additional anti-wear solution.

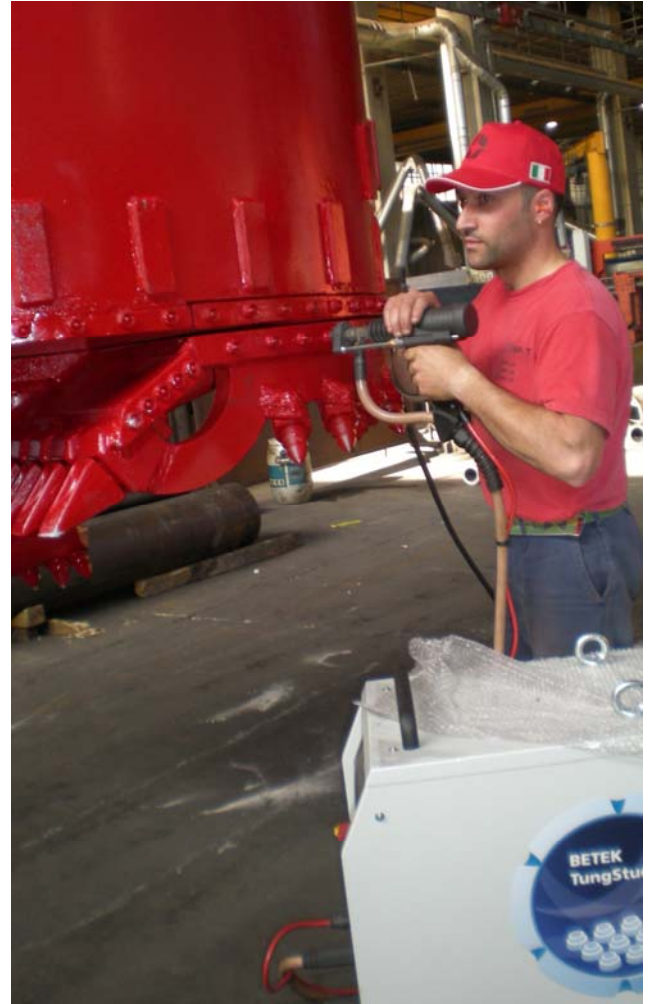

The reason of this perfect choice is explained by Francesco Cantisani *"collecting data from different job site, testing our tools in different soil conditions and studying the performance in environments varying from soft soils to the most difficult geological conditions, we clearly understand clients needs concerning solution for high-wear situations.*

Thanks to Betek management we have identified the right TungStuds for our tools line and with them the appropriate stud-welding machine.

Our welders enjoyed a professional training with Betek technicians and the result was excellent.

Even the feedback from job sites is super and nowadays all our clients require tools with TungStuds.

SIP&T quality has improved and we are very pleased to have done that with Betek support".
